COCA-COLA INDONESIA

Lower-sugar growth in Indonesia

2027–2031 marketing strategy

US$10m growth proposal

A focused launch for Coke Zero and Ades, with investment tied to paid repeat and portfolio contribution.

WORK SIMULATION PROGRAM / OCTOBER 2026

Open the proposal

Executive summary

I recommend a Greater Jakarta pilot because it concentrates lunch and commute occasions near measurable retail outlets. Test the drivers of paid repeat before releasing the remaining US$8.6m.

MY RECOMMENDATION

US$1.4m

A focused Greater Jakarta pilot
Coke Zero with meals
Ades for water on the go

LATER INVESTMENT

US$8.6m

Release funding when measured repeat and portfolio contribution support the next expansion.

US$10m ceiling

Year 5 illustrative base payback

Explore the sections

Proposal. Economics are illustrative and depend on validation. See model assumptions and references.

CALP: how I frame the recommendation

The masterclass separates the business problem from possible solutions. I apply its four steps to the audience, purchase barriers and funding decision.

C	**Clarify & contextualize**	Grow lower-sugar portfolio contribution in Indonesia within a five-year US$10m marketing budget.
A	**Analyze the drivers**	Define the audience, then test taste, chilled stock, price acceptance and occasion fit.
L	**List solutions**	Compare product, pricing, access and awareness options before choosing the launch.
P	**Prioritize the solutions**	Fund the first pilot. Release later investment when paid repeat and portfolio returns justify it.

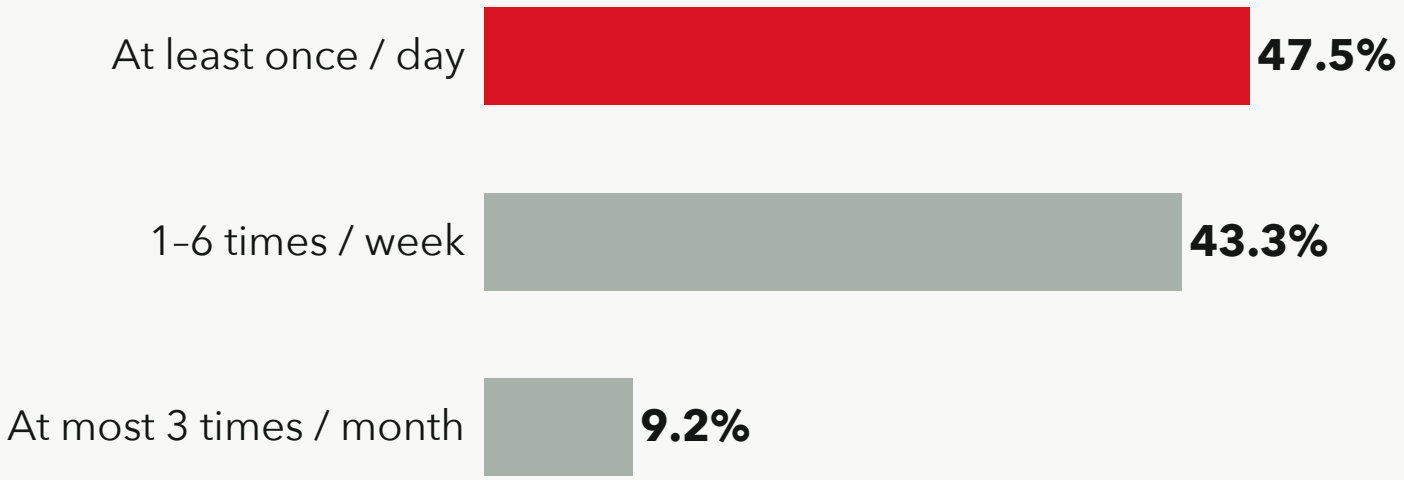

The proposed social post **Explore the scenarios** **Evidence and model**

Framework: WSP Masterclass 1, Thinking Strategically, CALP. Applied here to the Coca-Cola brief.

Sweet drinks are already a frequent habit

Frequent consumption suggests testing an alternative within an existing routine. The survey describes a national habit. Paid purchases and subsequent repeat must establish whether the proposed adult audience will switch.

REPORTED SWEET-DRINK CONSUMPTION FREQUENCY

47.5%

consume sweet drinks at least once daily

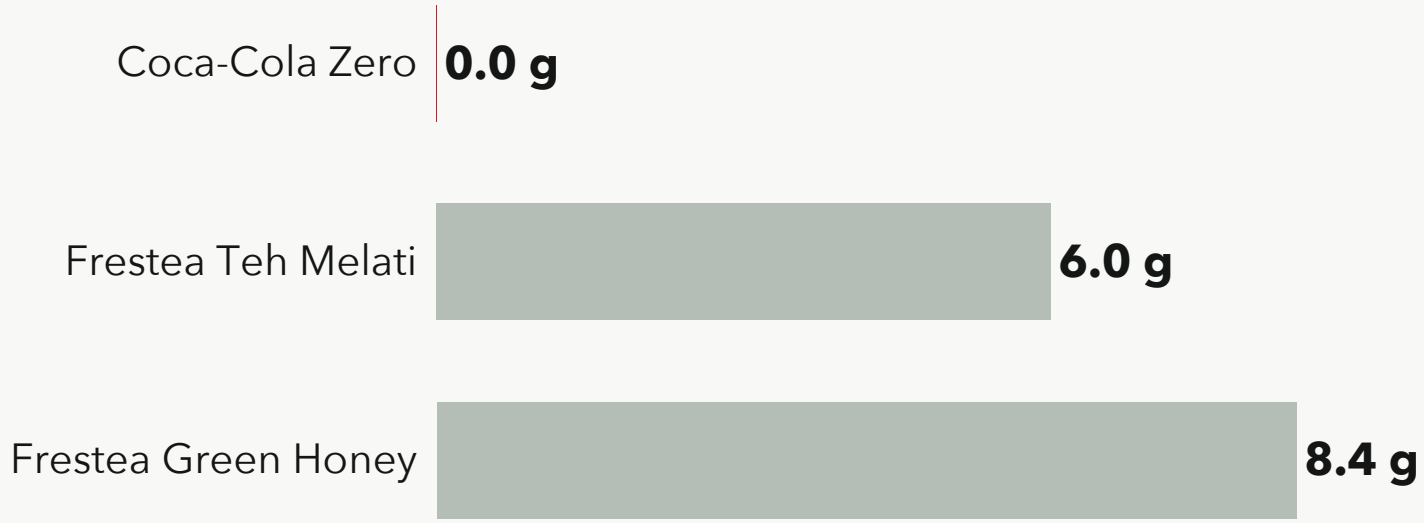

The sample introduces the product.
Compare paid trial and repeat with holdouts to estimate additional purchases.

Ministry of Health, SKI 2023, Table 11.49, p446. Indonesia, age 3+. Frequency categories shown as published. Ref. 1.

Coke Zero and Ades as the first test

Existing local products allow a demand test without a new formulation. Use the published nutrition for each variant, then establish whether taste, stock and repeat justify further investment.

SUGAR PER 100 ML

THE LAUNCH PORTFOLIO

Coke Zero

0 g sugar per 330 ml
Meal occasion

Ades

Plain mineral water
Everyday hydration

Tea, juice and functional labels alone do not establish a health benefit.

Official product pages. Sugar normalized per 100 ml from published servings. References 8–10.

The first barriers: taste and chilled stock

I prioritise testing taste and chilled availability as plausible barriers to paid repeat. Price and occasion tests refine the offer. Wider reach waits for a viable offer and available stock.

	GROWTH DRIVER	WORKING HYPOTHESIS	TEST BEFORE SCALING
01	**Taste doubt**	Acceptable taste increases paid repeat.	Blind taste test, then paid purchase
02	**Cold availability**	Chilled stock reduces missed purchases.	Store audits and matched holdouts
03	**Price friction**	A price premium may weaken trial.	Parity vs small-premium cells
04	**Occasion fit**	A relevant occasion improves response.	Meal vs hydration creative

Priority: chilled availability and taste.
Defer premium pricing and mass reach until paid repeat supports expansion.

Proposed hypotheses. Test results, rather than assumed preferences, determine the priority.

Working adults in Greater Jakarta

Lunch and commute routines offer repeated opportunities to observe purchases. Concentrating the proposed audience in one area makes store comparisons manageable. Interviews and paid tests must assess its response.

21–35 years

working adults in Greater Jakarta

Matched stores estimate sales lift.
Interviews refine the offer.
Paid tests reveal price acceptance.

Price test: parity vs a small premium

Workplace and commute routines

Nearby outlets allow matched-store comparisons

Selected age group and city are test hypotheses. BPS national urban data do not establish this segment's preferences.

The options I would fund first

I compare the options by their likely effect on paid repeat, delivery requirements and ability to measure results. These priorities are hypotheses for the pilot to test.

OPTION	GROWTH LOGIC	FUNDING CHOICE
Taste trial + chilled access	Address taste doubt and missed purchases using existing local products.	**Fund first** **Measure paid trial and repeat.**
Premium pricing	Could improve unit margin, but may reduce trial or repeat at the everyday price.	**Test in a small cell** **No premium assumed in the plan.**
Broad awareness	Could add reach once the offer works and nearby stock can serve demand.	**Conditional expansion** **Wait for contribution evidence.**
New formulations	Could address unmet needs, with added development and delivery requirements.	**Defer from this launch** **First test existing products.**

The first US$1.4m tests the priority hypotheses for repeat before funding wider reach.

Method: WSP Masterclass 1, CALP. Priority judgments are proposed, not observed results.

Coke Zero at lunch. Ades on the go.

The proposed roles are lunch for Coke Zero and workday hydration for Ades. Measure trial and repeat for each product separately before deciding which occasion merits more funding.

Coke Zero with meals

Food-led content, chilled trial
and a second paid purchase

Ades on the go

Workplace and commute access
Value and convenience earn repeat

Proposed positioning. Images illustrate occasions; the water bottle shown is unbranded concept imagery.

A controlled launch, then wider retail

Begin with outlets where stock and redemptions can be checked, subject to retailer agreement. Then test lunch warungs and supporting digital channels, comparing incremental contribution with the cost of each activation.

FIRST CONTROLLED PILOT

Modern trade

Near offices and commuter routes.
Stock audits and traceable redemptions support testing.

NEXT RETAIL CELL

Lunch warungs

Selected lunch outlets in general trade.
Meal bundles and chilled stock.
Scale cells that earn repeat.

CONVERSION SUPPORT

Social + quick commerce

Geo-target adults on Instagram.
Link to verified nearby stock.
Test carts alongside retail results.

400,000+

outlets in CCEP's stated Indonesia network.
This is a footprint, not confirmed access for the pilot.

Proposed sequence. Store access, retailer cooperation and local stock require confirmation. Refs 5, 12.

What existing campaigns tell us

Official campaigns inform a meal-based post linked to nearby trial. Taste and participation provide creative starting points. Campaign effectiveness and live-feed engagement could not be verified.

2023

#ZeroWords

Taste expression
and creator participation

Taste gives the creative a hook

Jan 2026

Digital sampling

Vouchers redeemed at
Alfamart and Indomaret

Vouchers can connect to retail

Sep–Oct 2026

Zero & V

Pop-culture incentive
with retail and food outlets

The next post adds a meal and nearby trial

Official Indonesian campaign materials, not a live-feed audit. Engagement, cadence and follower metrics were inaccessible. Refs 11–14.

The next lunch post

Test only the opening: food and taste versus sugar information. Keep the visual, offer, audience and placement constant. Compare incremental paid trial and eligible repeat, then assess portfolio contribution.

PROPOSED INSTAGRAM CAPTION

Makan siang favoritmu, ditemani Coca-Cola Zero Sugar dingin.
Rasa Coca-Cola, tanpa gula.

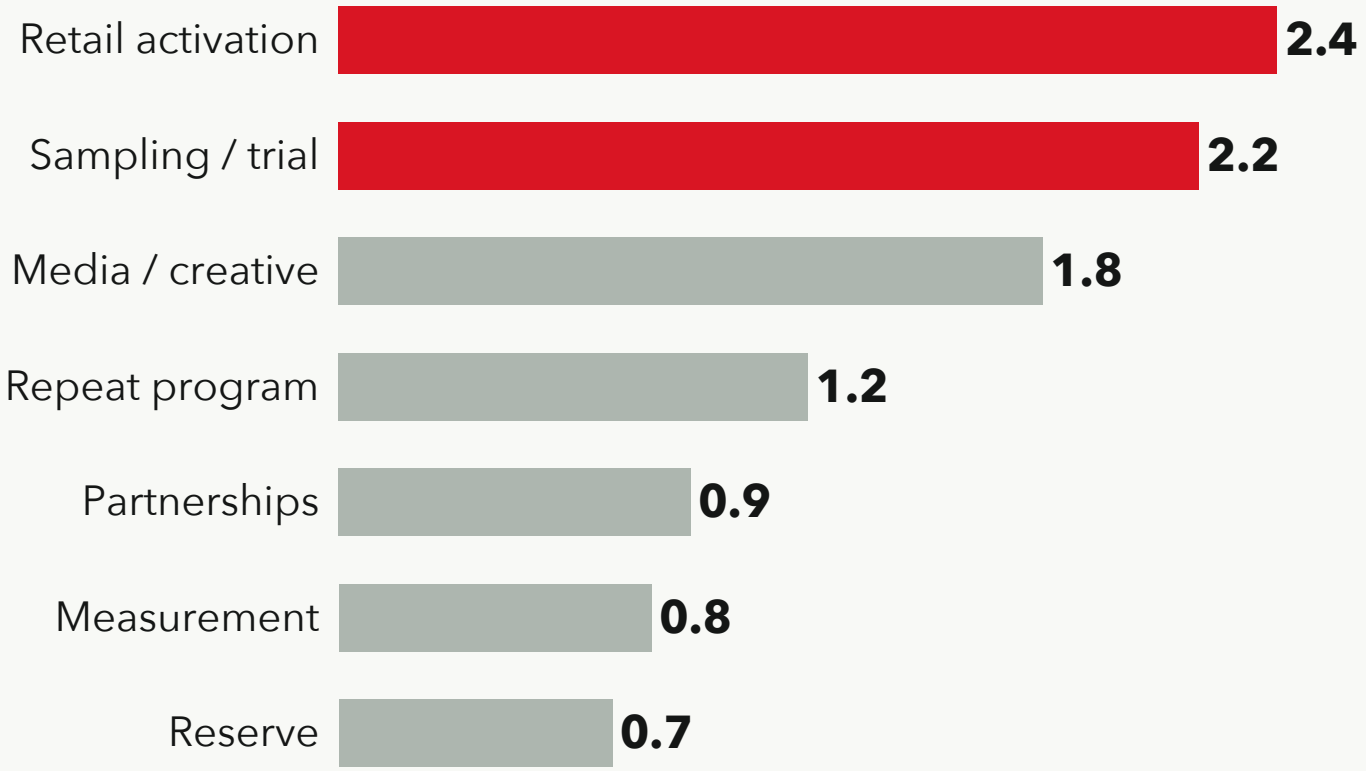

Cek lokasi uji coba lewat tautan di bio.
Pilih toko terdekat dan lihat ketersediaan produk.
#CocaColaZeroSugar #PilihanTanpaGula

Test: food-taste vs sugar-information opening
Judge: incremental paid trial, 60-day repeat and contribution

Proposed Instagram post. Confirm stock and bio link before use. Refs 8, 14, 18. Testing method: WSP Masterclass 2, slides 19–24.

Taste and access receive US$4.6m

Retail activation and sampling address the first two barriers: finding the product and trying it. Keep free distribution within marketing costs, and measure subsequent paid purchases separately.

46%

US$4.6m

to retail activation and sampling

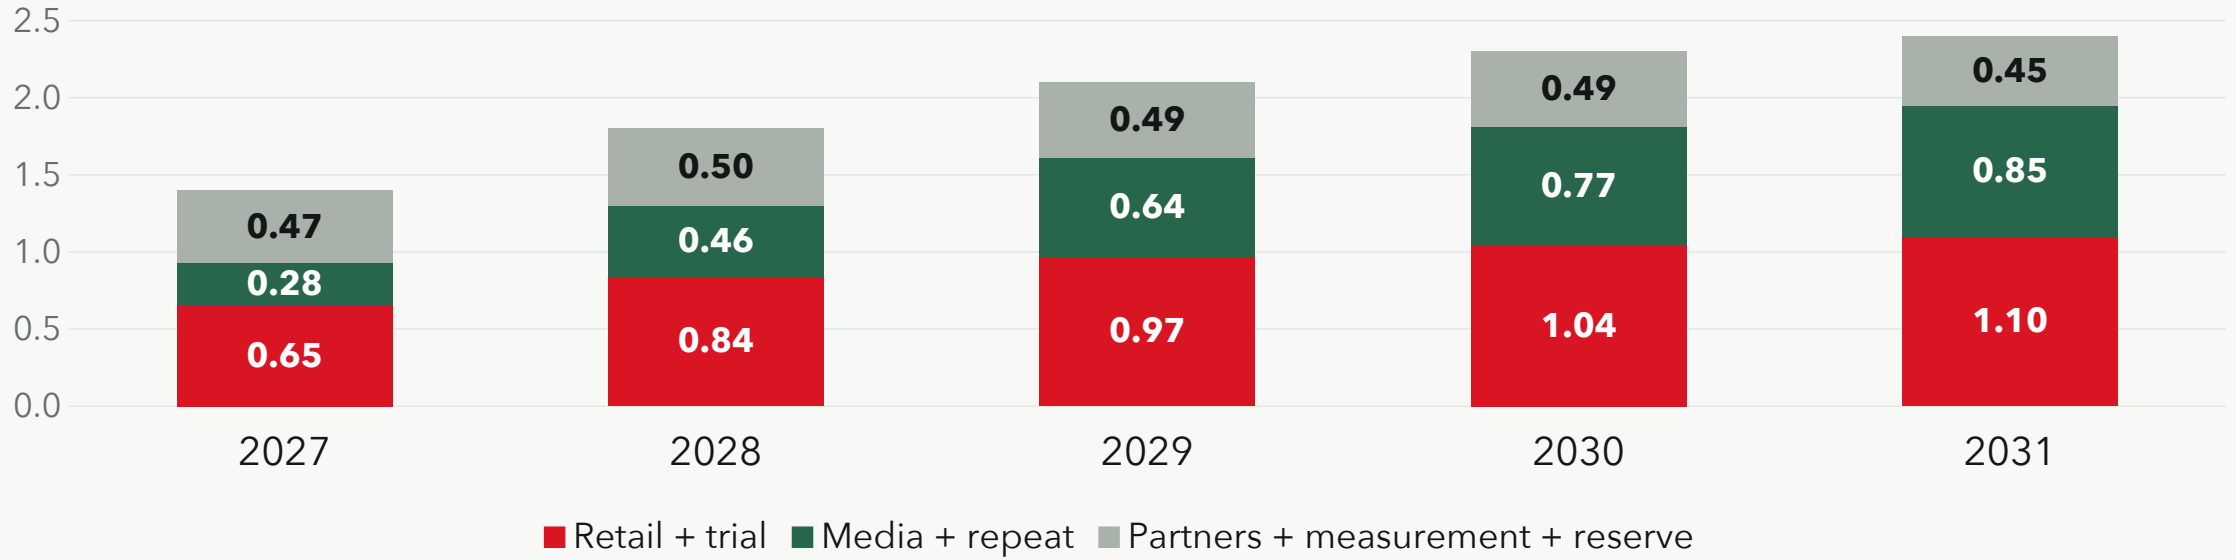

Existing bottling and routine distribution support the plan. New capex is outside this budget.

Proposed five-year allocation, US$m. Total US$10.00m. Annual detail in the appendix.

A five-year budget with release gates

The schedule limits the first commitment and reserves later spending for expansion supported by local results. Confirm retailer access and update the economics before treating any city or outlet target as committed.

ANNUAL MARKETING INVESTMENT, US$m

Prove

Greater Jakarta
Up to 1,000 stores

Replicate

Bandung / Surabaya
Up to 5,000 stores

Expand

Proven combinations
10,000 stores

Deepen

Strengthen repeat
20,000 stores

Extend

Selective coverage
30,000 stores

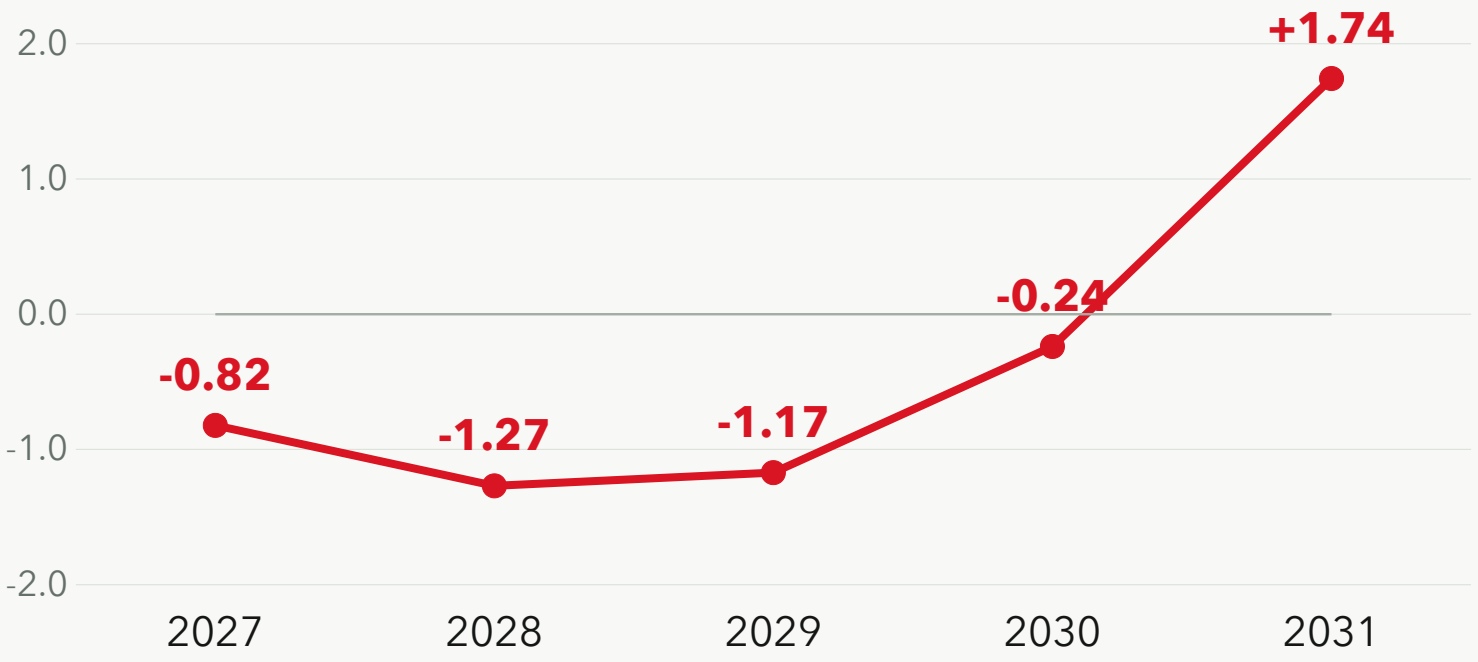

US$0.35m of the US$1.40m first-year budget funds the initial 90-day test.

Proposed tranches. City and outlet access require local confirmation. The first 90-day test sits inside Year 1.

Base-case payback arrives in 2031

In the model, annual contribution becomes positive before cumulative marketing outlays are recovered. That delay makes the result sensitive to retention and unit economics, which remain unvalidated assumptions.

CUMULATIVE CONTRIBUTION AFTER MARKETING, US$m

US$37.36m

five-year incremental net revenue

US$1.74m

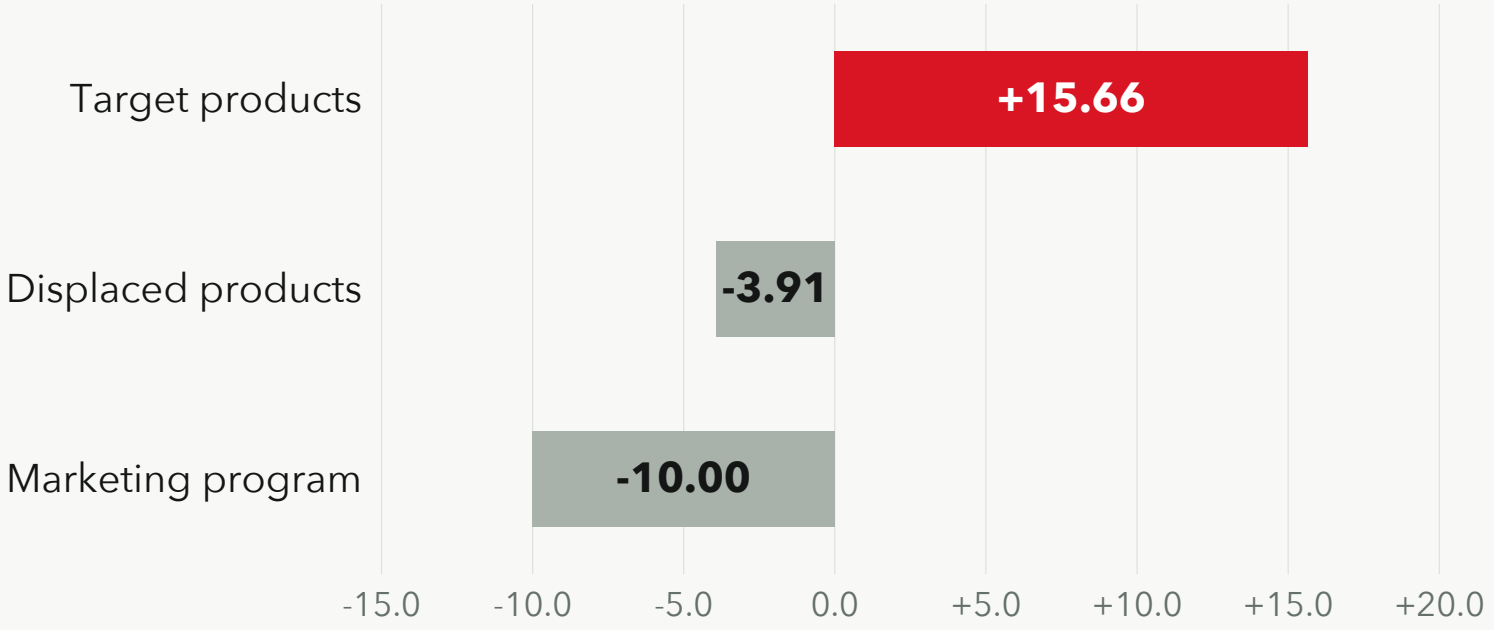

contribution after the US$10m marketing program

Illustrative manufacturer / bottler contribution. Undiscounted. Excludes tax, financing, capex, inflation, FX and working-capital timing.

Contribution after displaced sales

Some target-product purchases may replace existing sales. Subtract their lost contribution and the full marketing program before assessing the result. The displayed components reconcile the illustrative base case.

COMPONENTS OF FIVE-YEAR CONTRIBUTION, US$m

+US$1.74m

after displacement and marketing

US$15.66m – US$3.91m
≈ US$11.74m before marketing

US$11.74m – US$10.00m
= US$1.74m after marketing

The result depends on the margin gained and the margin given up.

Illustrative five-year contribution, US$m. Equal US$0.11 target/displaced unit margins. Calculations use unrounded values.

How could the returns change?

Choose a case to inspect the assumptions. Each outcome uses the same five-year marketing budget, with retention and purchase frequency held constant.

A weaker launch

–US$3.76m

Lower acquisition
35% displacement
$0.09 contribution per unit

Explore this case

Base case

+US$1.74m

Base acquisition
25% displacement
$0.11 contribution per unit

Explore this case

A stronger launch

+US$9.66m

Higher acquisition
15% displacement
$0.13 contribution per unit

Explore this case

Compare every assumption

What if retention changes?

Illustrative scenarios. No assigned probabilities. Contribution after US$10m marketing, 2027–2031.

The first 90 days

Run separate controlled tests, changing one factor at a time. Compare paid sales with holdout stores and follow eligible buyers for the full repeat window. Update the economics before wider rollout.

Days 1–15

Prepare

Audit stock and prices
Interview shoppers
Set holdouts and power the test

Days 16–60

Activate

100 test + 100 holdout stores
One factor per controlled test
Incremental paid trial, then repeat

Days 61–90

Evaluate

Follow early paid cohorts
Update portfolio economics
Extend an inconclusive test

≥95% audited on-shelf availability target

≥25% paid repeat within 60 days
Proposed management hurdle

Scale gate: measured portfolio contribution and a conservative repeat outlook cover the remaining spend.

Proposed hurdles, not benchmarks. A 60-day repeat result does not establish annual retention. Method: WSP Masterclass 2, slides 19–25.

When spending should stop

Set the response to weak repeat, missing stock, unsupported claims and compromised data before launch. Use those rules to pause affected spending even when headline trial or target-product sales look strong.

RISK	CONTROL	STOP OR REDIRECT WHEN
Cannibalization	Measure target and displaced SKU margins	Portfolio contribution fails the gate
Price / taste	Blind taste and paid price tests	Trial lifts but repeat stays weak
Stock / leakage	Weekly audits and unique codes	Stock is unavailable or codes leak
Claims / trust	Verified pack claims and adult targeting	Health language lacks support
Data misuse	Minimal consented data, duplicate checks	An activation is compromised

Proposed controls. Brand lead, local bottler sales and analytics share accountability.

The first-year decision

Approve the first-year pilot, beginning with the test already included in its budget. Subsequent funding should depend on paid repeat, contribution after displaced sales and a conservative assessment of future returns.

US$1.4m

Greater Jakarta, 2027

Coke Zero with meals. Ades on the go.

Evidence and model

Return to contents

US$8.6m stays conditional on paid repeat and portfolio contribution.

Proposal only. Subsequent investment remains conditional on measured commercial performance.

Evidence, case inputs and assumptions

Use the brief's channel mix as supplied context and preserve each external statistic's scope. The financial projections rely on planning assumptions that local results must replace or revise.

Evidence	Examples	Use in this proposal
Supplied case inputs	US$10m over five years 55% / 32% / 13% channel mix	Budget constraint retained Mix used as case context only
External observations	Ministry of Health, BPS, labels Official company disclosures	Preserve date and population Do not infer purchase demand
Planning assumptions	Audience, budget and retention Margins and cannibalization	Test with controls Replace with measured local values

Market-growth arithmetic

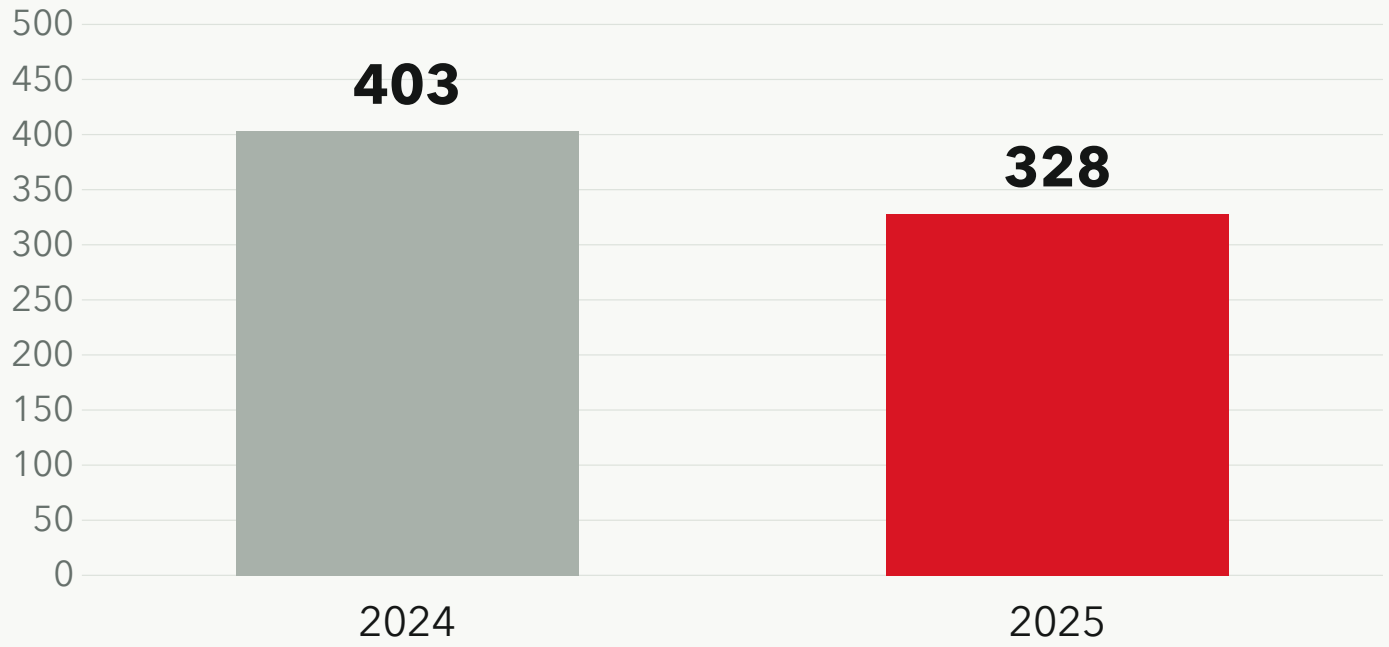

The brief's US$61bn (2024) to US$83bn (2030) implies ~5.27% CAGR, not 6.3%.
The model excludes this unverified market-size input.

Case inputs, external observations and planning scenarios remain distinct. Reference 7.

Indonesia sales context

Revenue combines changes in volume, price, mix and currency. Keep reported and currency-neutral results separate, and use the pilot to establish whether marketing generates additional contribution.

INDONESIA REPORTED REVENUE, EURm

−18.6%

FY2025 reported revenue change
−12.7% on an FX-neutral basis

H1 2026: flat

FX-neutral revenue vs H1 2025
Reported revenue fell 11.8%

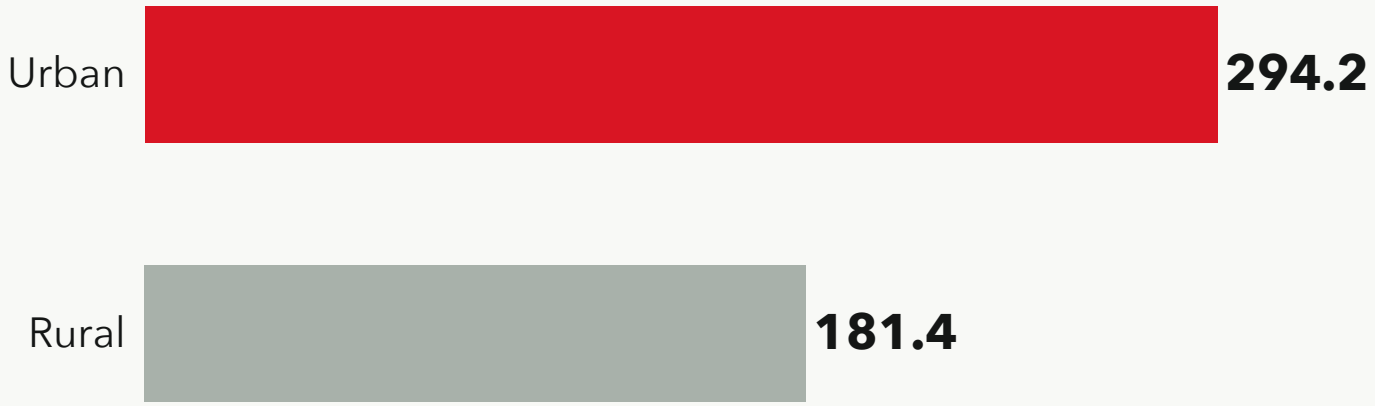

Revenue reflects price, mix, volume and currency. It does not identify the cause of demand changes.

CCEP FY2025 Annual Report, pp50 and151. Revenue by origin of sale, EURm. H1 2026 results published 4 Aug 2026. Refs 6, 19.

Urban meal spending

The spending difference supports exploring urban meal occasions. These averages include food and consumers of all ages, so local price and purchase tests must establish the beverage offer.

MONTHLY PER-CAPITA EXPENDITURE, Rp THOUSANDS

62% higher

urban spending per person
compared with rural areas

Urban: Rp294,188
Rural: Rp181,387

Compare price parity with a small premium in matched outlets.
These averages cannot establish packaged-beverage demand or willingness to pay.

BPS Susenas, March 2025. Prepared food and beverages, monthly per capita, current rupiah. All ages. Ref. 3.

Alternatives at the same meal

Published ranges show that shoppers already have tea and water alternatives. The pilot must establish whether the proposed combination of taste, availability and price earns purchases from those existing choices.

Customer choice	Existing proposition	Response for Coca-Cola
Tehbotol Sosro	Original, Less Sugar and Tawar Explicit meal positioning	Earn a cola-taste switch Prove paid repeat
AQUA / Le Minerale	Portable everyday water Source and mineral messaging	Compete on availability and value No health-superiority claim
Sweet drinks at lunch	Familiar taste and routine A local hypothesis to test	Keep the meal and price familiar Offer a clear sugar choice

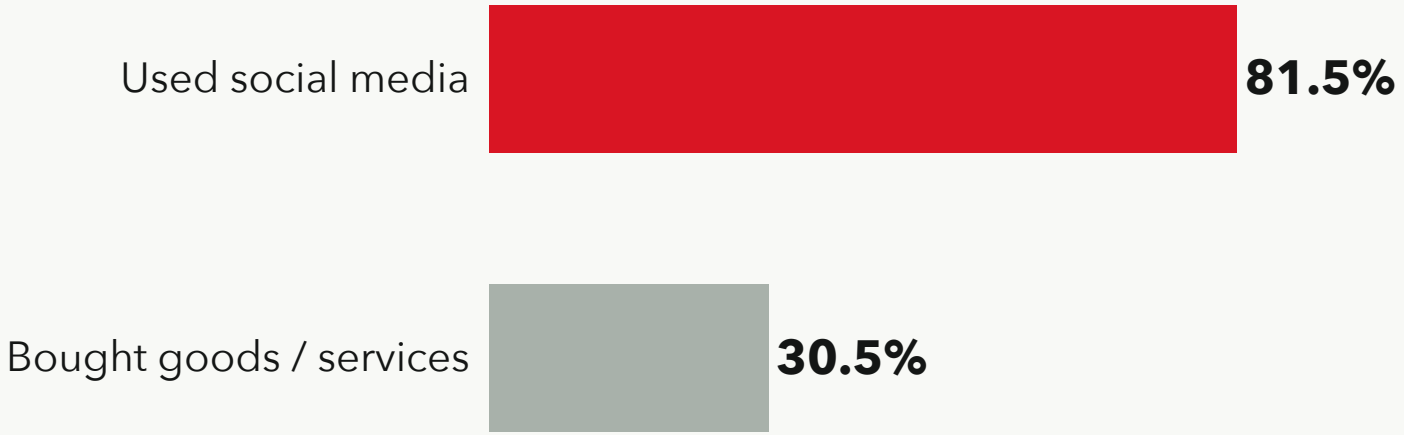

Local price and stock audits define the reference offer before launch

Official brand propositions, not consumer preference or market share. References 15–17.

Social use and online shopping differ

Use social content to introduce the offer and direct shoppers to available stock. The reported online activities overlap. Measure actual incremental purchases and repeat rather than treating them as a funnel.

URBAN INTERNET USERS, 2025

+90%

Indonesia video-commerce 2025 report, YoY transaction growth

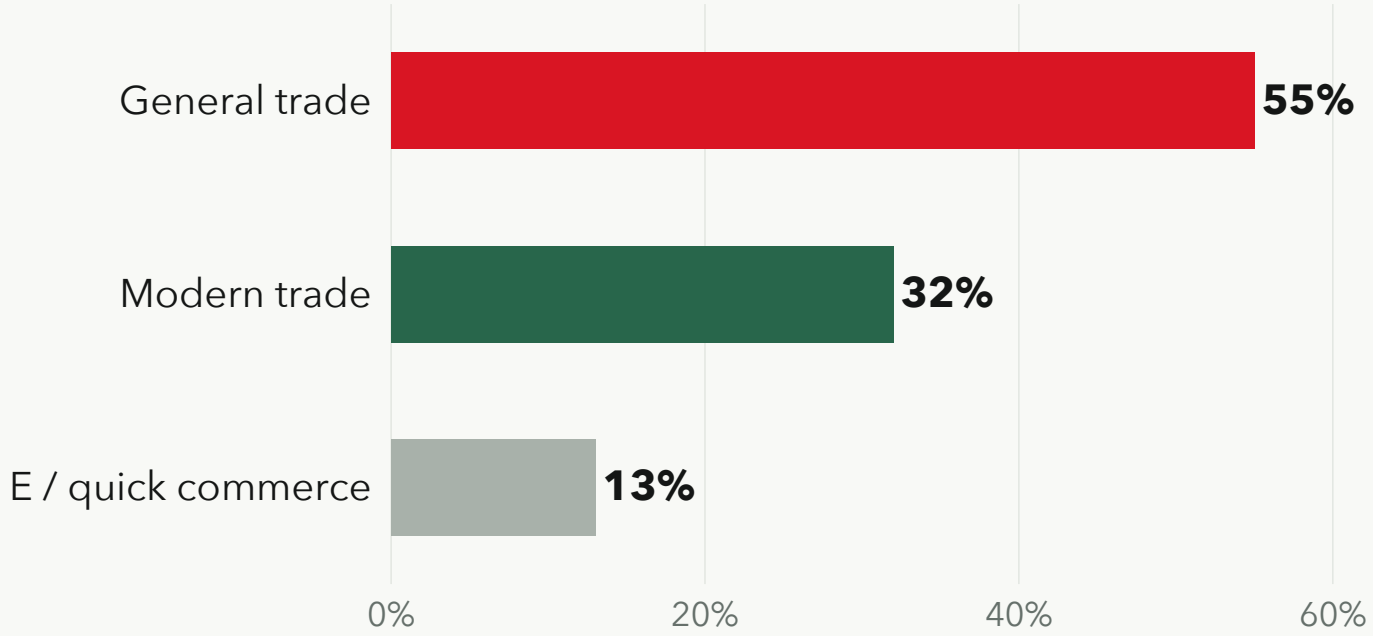

Compare matched retail cells with and without activation. Separate media response from stock availability and price.

BPS 2025: age 5+, urban internet users, nonexclusive purposes. Google video-commerce growth is all-category. Refs 2, 4.

The channel mix supplied in the case

General trade leads in the supplied case, while modern trade offers a proposed starting point for tracking stock and purchases. Use these unverified shares as context when testing the sequence.

COCA-COLA SALES MIX IN THE SUPPLIED CASE

55%

of case sales sit in general trade

Pilot choice: traceable stock and paid sales first.
Scale choice: the cells that earn repeat at viable margins.

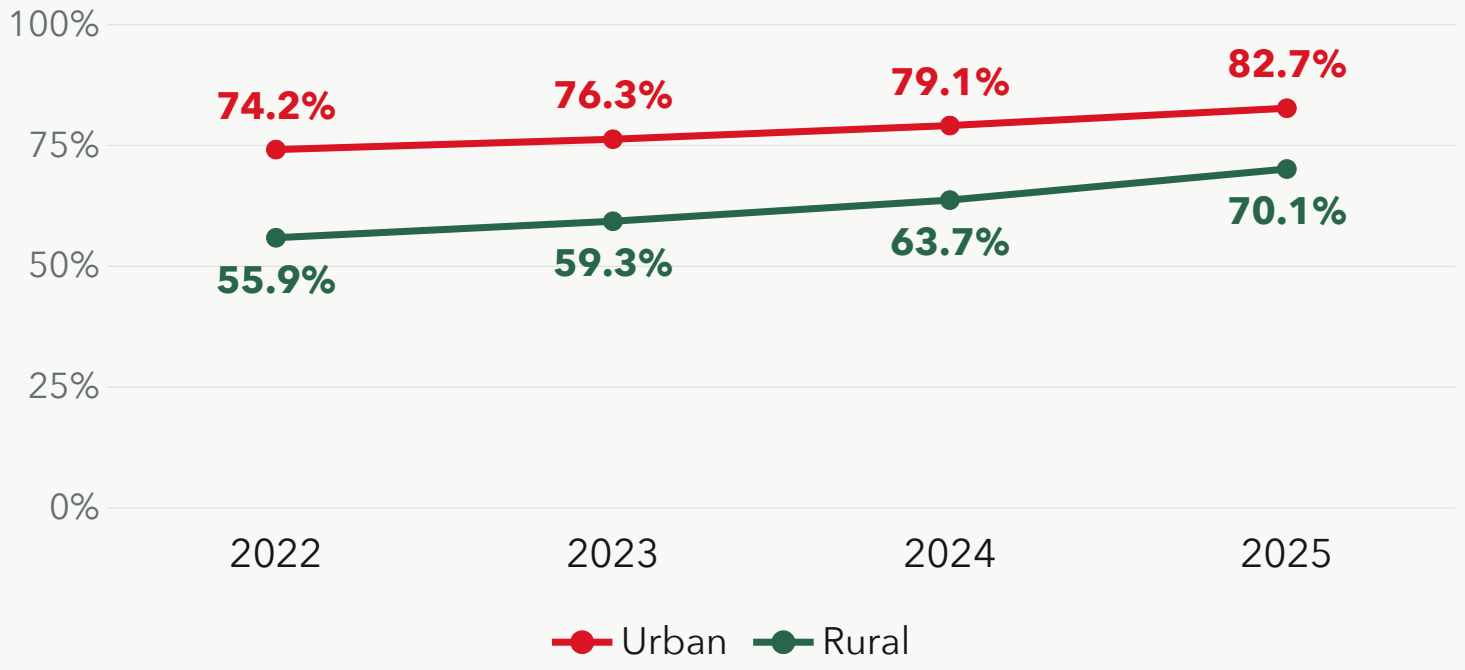

The test sequence follows measurement needs. The case mix describes the starting context.

WSP October 2026 brief, Section II: supplied case inputs, not independently verified current market statistics. Ref. 7.

Mobile access in urban Indonesia

Design the content and store locator for mobile use, with local availability checked before promotion. Internet access makes contact possible. The offer still needs to earn a purchase.

INTERNET ACCESS, % OF RESIDENTS AGE 5+

82.72%

urban residents used the internet in 2025

98.89%

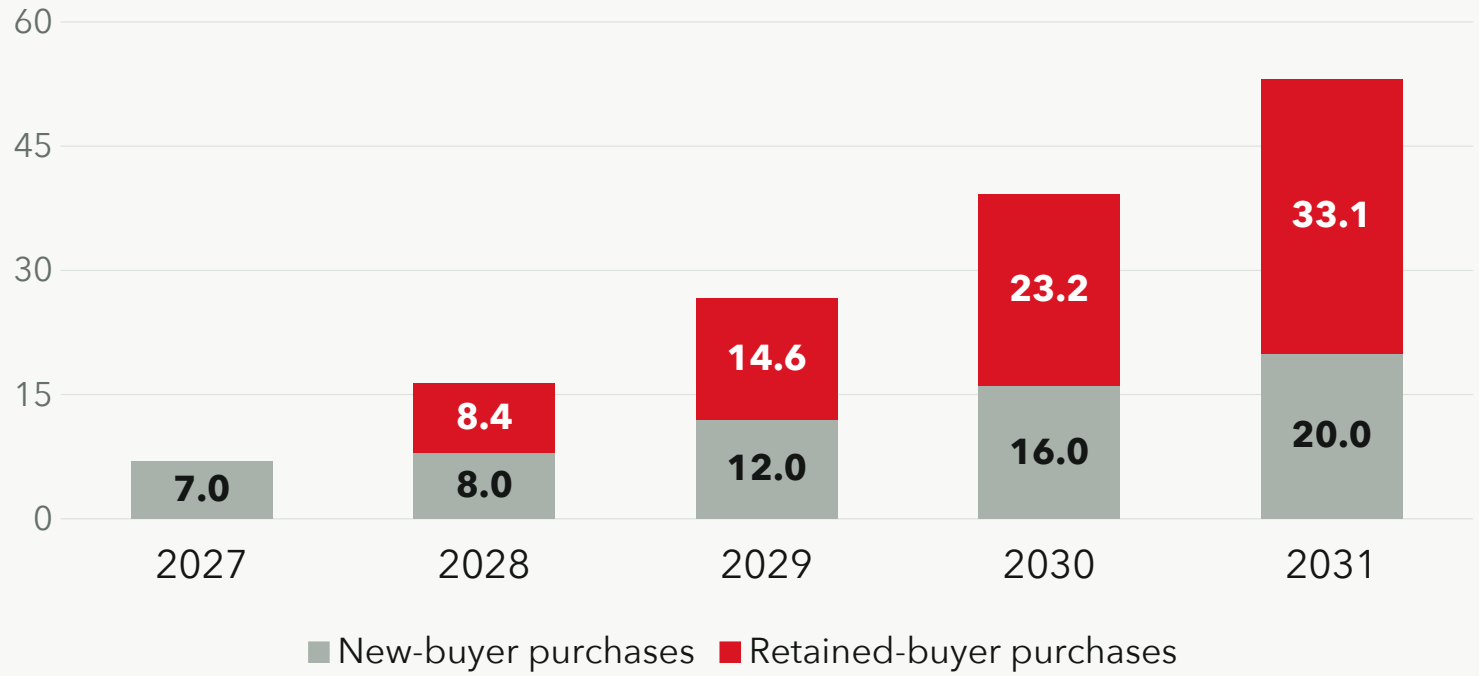

of urban internet users accessed via mobile

BPS, Telecommunication Statistics 2025, Appendices 8, 9 and 20. Internet use in prior 3 months, age 5+. Ref. 2.

The volume assumption depends on repeat

Retained buyers account for most final-year volume in this model. Acquisition therefore needs longer follow-up: a second purchase within 60 days cannot establish annual retention or future purchase frequency.

TARGET-PORTFOLIO PAID UPLIFT BEFORE DISPLACEMENT, MILLION PACKAGES

62.3%

of 2031 uplift units come from retained buyers

Assumed annual retention: 60%
10 units per new buyer
20 per retained buyer
25% displacement deducted later

A 60-day second purchase does not establish annual retention or purchase frequency.

Illustrative planning model. Not a forecast. All acquisition, repeat, margins and displacement assumptions require local validation.

How the three scenarios compare

These scenarios change acquisition, displacement and unit economics together, with retention and purchase frequency held fixed. Use them to challenge the funding decision. They have no assigned probabilities.

FIVE-YEAR CONTRIBUTION AFTER MARKETING, US$m

Downside	Base	Upside
−3.76	+1.74	+9.66

Scenario inputs	Downside	Base	Upside
Buyer acquisition vs base	−25%	Base	+25%
Cannibalization	35%	25%	15%
Net revenue / unit	$0.32	$0.35	$0.38
Contribution / unit	$0.09	$0.11	$0.13
Incremental net revenue	$22.20m	$37.36m	$57.47m

90.91m net units to break even

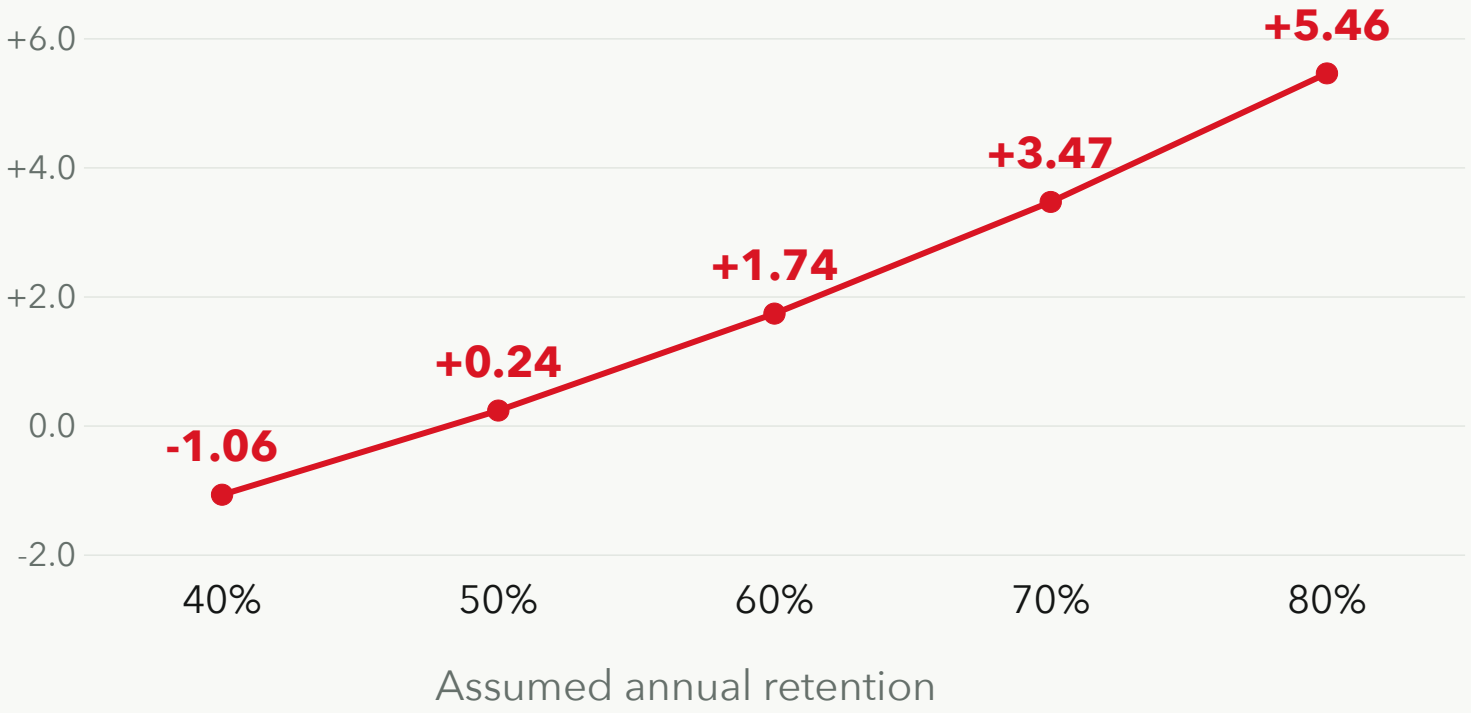

Base volume can fall 14.8% before break-even.

Illustrative scenarios, no assigned probabilities. Displaced-product margins can materially change the return.

Lower retention leaves little headroom

Lower annual retention leaves fewer returning buyers to support later volume. This sensitivity holds the other base assumptions fixed, showing why longer follow-up matters before the next spending decision.

FIVE-YEAR CONTRIBUTION AFTER MARKETING, US$m

US$1.50m

less contribution at 50% versus 60% annual retention

Use longer cohort follow-up and a conservative retention case before each expansion.

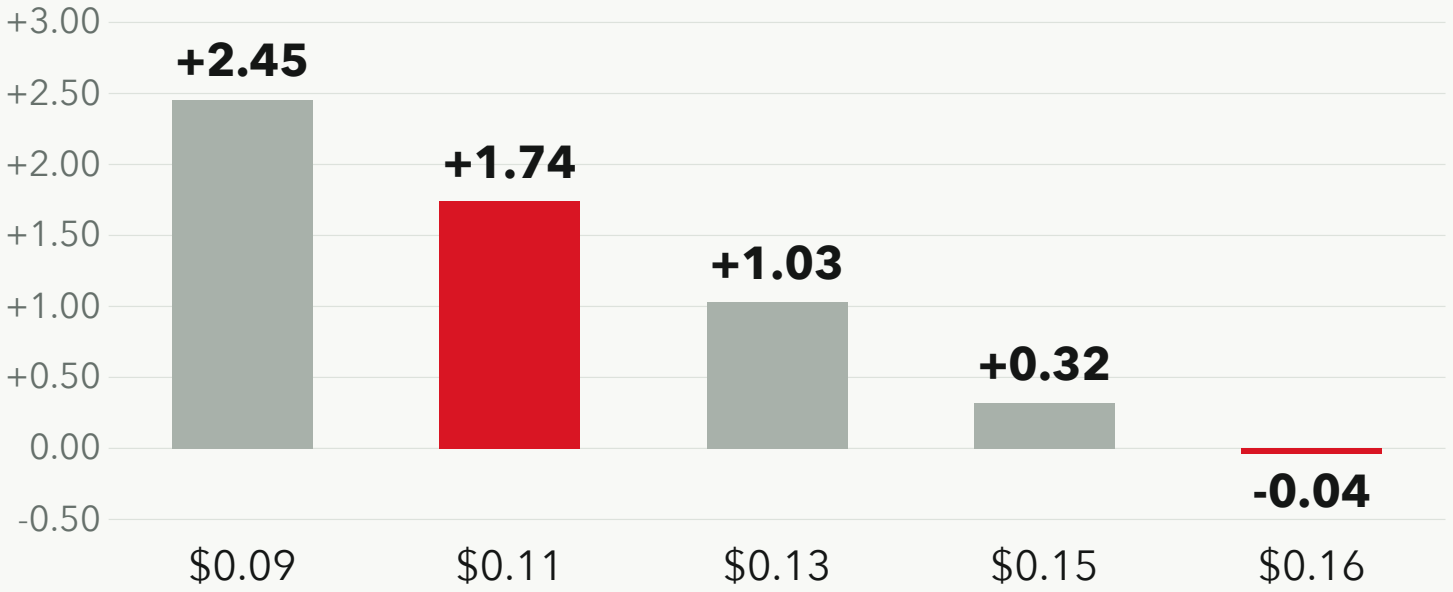

At 40% retention, the model loses US$1.06m despite unchanged buyer acquisition.

Illustrative one-variable sensitivity. Acquisition, unit economics, 25% displacement and US$10m marketing held at base assumptions.

The cost of displacing higher-margin sales

A switch can add target-product sales while reducing total contribution. Measure both margins before expanding. This sensitivity changes only the contribution lost on displaced units, holding the other assumptions fixed.

FIVE-YEAR CONTRIBUTION AFTER MARKETING, US$m

–US$0.04m

when the displaced SKU earns $0.16 per unit and the target mix earns $0.11 per unit

A switch must improve total portfolio contribution before it earns more funding.

Illustrative sensitivity. Only displaced-product contribution changes. Base uplift, 25% cannibalization and US$10m spend held constant.

Base-case calculations

Start with new buyers, add returning cohorts and apply their assumed purchase frequencies. Deduct displaced sales before marketing costs, and exclude samples and ordinary demand when estimating incremental lift.

Model	2027	2028	2029	2030	2031
New incremental buyers, m	0.70	0.80	1.20	1.60	2.00
Target-portfolio uplift units, m	7.00	16.40	26.64	39.18	53.11
Net incremental units, m	5.25	12.30	19.98	29.39	39.83
Net revenue, US$m	1.84	4.31	6.99	10.29	13.94
Contribution after marketing, US$m	**–0.82**	**–0.45**	**0.10**	**0.93**	**1.98**

60% annual retention. 10 acquisition-year units. 20 units per retained buyer.

25% cannibalization. Target and displaced SKUs both earn $0.35 revenue and $0.11 contribution per unit.
Assumed mix: 60% Coke Zero / 40% Ades. All inputs require local validation.

All figures are illustrative. One unit means one paid single-serve package. Manufacturer / bottler economics.

The full US$10m allocation

The table accounts for each marketing cost once. Sampling includes free product and execution. Discounts reduce realized revenue, while local quotes and measured margins determine revisions to later allocations.

Investment	2027	2028	2029	2030	2031	Total
Retail activation	0.30	0.42	0.52	0.56	0.60	2.40
Sampling / trial	0.35	0.42	0.45	0.48	0.50	2.20
Media / creative	0.18	0.28	0.38	0.46	0.50	1.80
Repeat execution	0.10	0.18	0.26	0.31	0.35	1.20
Local partnerships	0.10	0.16	0.20	0.22	0.22	0.90
Measurement	0.23	0.18	0.15	0.12	0.12	0.80
Conditional reserve	0.14	0.16	0.14	0.15	0.11	0.70
Total	**1.40**	**1.80**	**2.10**	**2.30**	**2.40**	**10.00**

Proposed marketing allocation, US$m. Discounts sit in net revenue; free sampling product cost sits here.

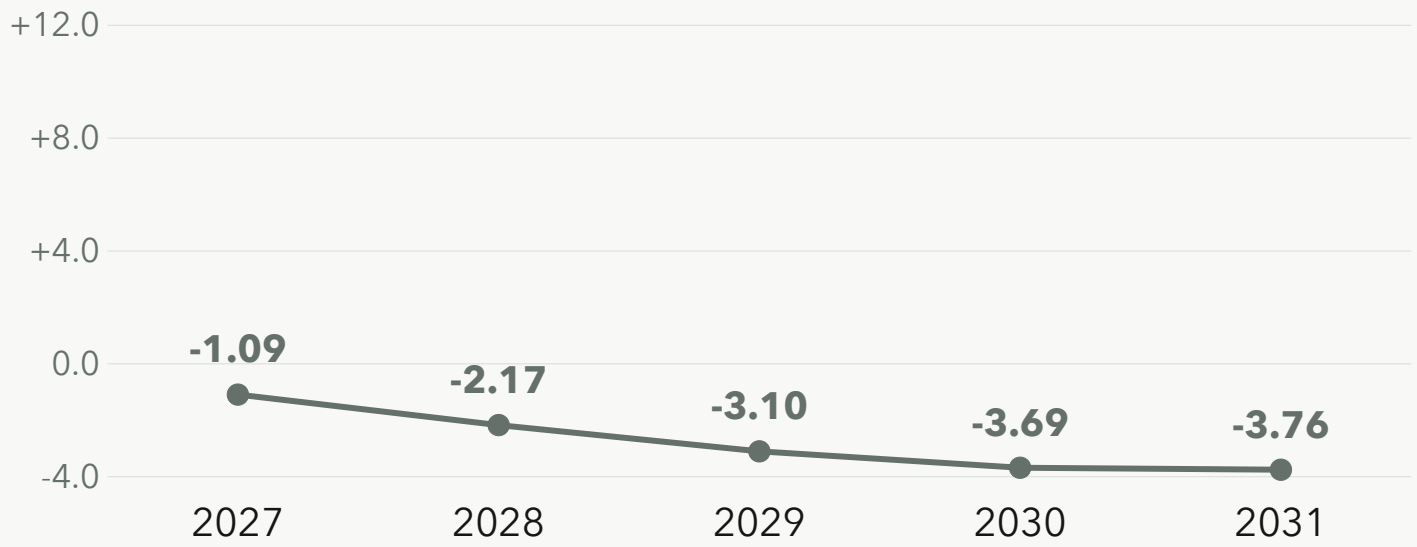

A weaker launch loses US$3.76m

Fewer new buyers and thinner unit margins leave the program short of payback. More displacement also reduces the value of the additional target-product sales.

Weaker launch | **Base case** | **Stronger launch**

Back to scenarios

CUMULATIVE CONTRIBUTION AFTER MARKETING, US$m

–US$3.76m

No payback by 2031

Acquisition: 25% below base
Displacement: 35%
Net revenue / unit: $0.32
Contribution / unit: $0.09

Compare all assumptions

60% annual retention. 10 units per new buyer in the acquisition year. 20 per retained buyer-year.

Hold the expansion budget. Adjust the offer and retest if measured results resemble this case.

Illustrative, undiscounted model. US$10m marketing. Excludes tax, financing, capex, inflation, FX and working-capital timing.

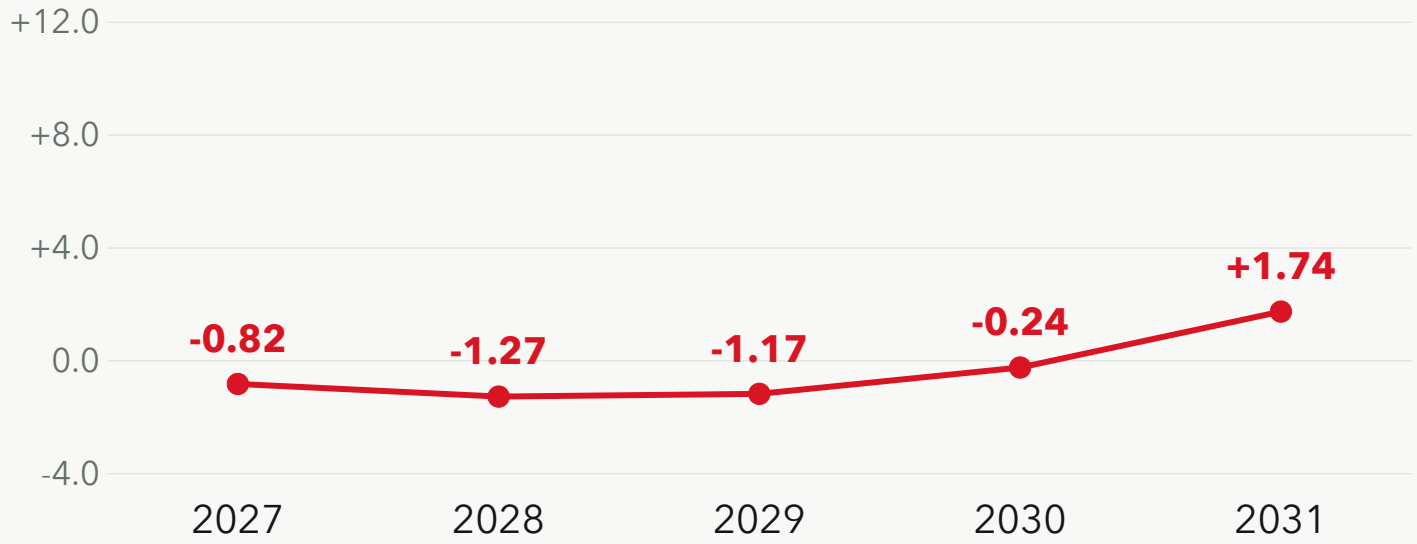

The base case earns US$1.74m

Repeat purchases gradually recover the early marketing outlay. Payback arrives in 2031 under the base assumptions, leaving a modest cushion against weaker retention or higher displaced-product margins.

Weaker launch | **Base case** | **Stronger launch**

Back to scenarios

CUMULATIVE CONTRIBUTION AFTER MARKETING, US$m

+US$1.74m

Payback in 2031

Acquisition: Base acquisition
Displacement: 25%
Net revenue / unit: $0.35
Contribution / unit: $0.11

Compare all assumptions

60% annual retention. 10 units per new buyer in the acquisition year. 20 per retained buyer-year.

Approve the first US$1.4m. Update repeat and portfolio margins before releasing later funding.

Illustrative, undiscounted model. US$10m marketing. Excludes tax, financing, capex, inflation, FX and working-capital timing.

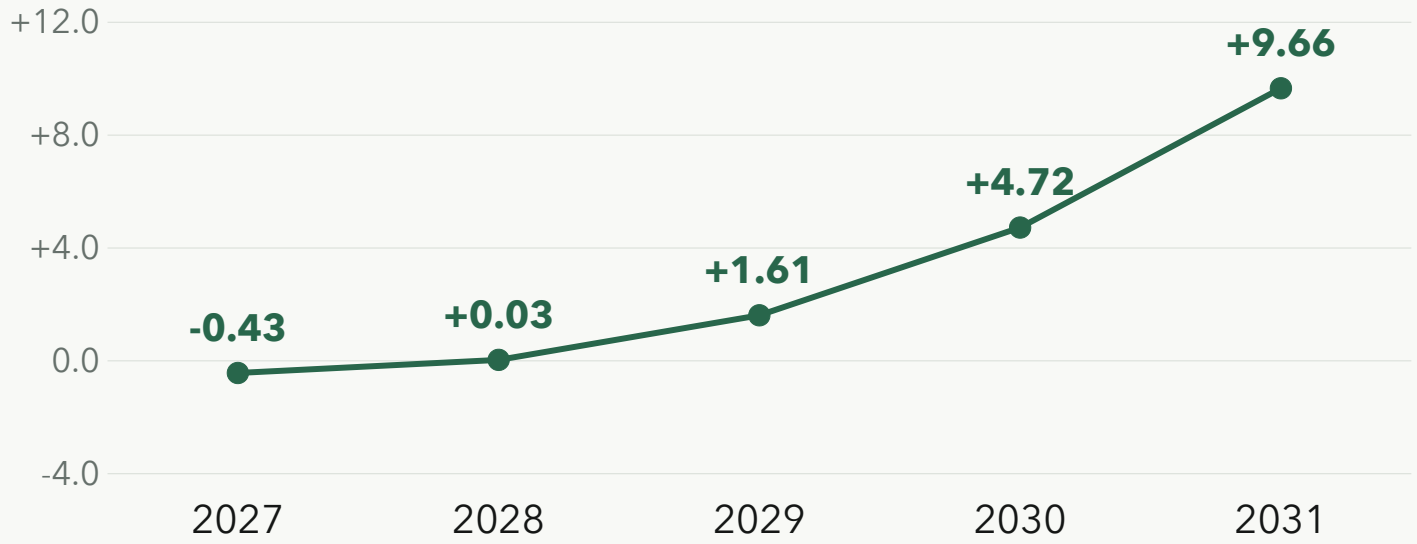

A stronger launch earns US$9.66m

Stronger acquisition and unit economics create more room to expand. Lower displacement protects the existing portfolio, while the model still assumes the same retention and purchase frequency.

Weaker launch | **Base case** | **Stronger launch**

Back to scenarios

CUMULATIVE CONTRIBUTION AFTER MARKETING, US$m

+US$9.66m

Payback in 2028

Acquisition: 25% above base
Displacement: 15%
Net revenue / unit: $0.38
Contribution / unit: $0.13

Compare all assumptions

60% annual retention. 10 units per new buyer in the acquisition year. 20 per retained buyer-year.

Expand the city and occasion combinations that prove their value, using the same release gates.

Illustrative, undiscounted model. US$10m marketing. Excludes tax, financing, capex, inflation, FX and working-capital timing.

Sources: market and commercial context

The linked sources identify populations, periods and company reporting bases. Read those limits alongside each chart: the observations establish context, while the commercial projections remain explicit planning assumptions.
